Gaining understanding in the significance of phosphorylation, ubiquitination, and SUMOylation is key to determining how these processes contribute to human disease (Neuberger and Yang, Chem. Rev. 107:279-324, 2007). Small ubiquitin-like modifier (SUMO) is a newly recognized post-translational modification (Kaiser, Nature 448:171-175, 2007). Unlike ubiquitin, SUMO has four additional lysines from which ubiquitin is formed, that function to create the isopeptide bond. SUMO is conjugated in the form of a di-anionic motif to the ε-amino group of lysine residues in target proteins, often on the surface of the protein (Thomas et al., Cell 109:147-157, 2002). SUMO is one of the smaller proteins, and possesses a small reversible conjugation site (Kaiser, Nature 448:171-175, 2007). SUMOylation is a highly dynamic process, and can vary in efficiency and protein specificity (Simon et al., Nature 448:611-616, 2007). SUMO may be targeted to multiple lysines, but the consensus motif is K(X)K(X)S/T and contains a lysine, a serine, and an acidic residue (Fachinetti et
